Abstract

Anti-aging should be considered as a global phenomenon. In order to study the structural age related skin damage from depth to surface, we consider 3 levels:

- 1-Epidermis and Dermis with useful confocal microscopy
- 2-Skin Surface with Pigmentation assessment viewed by confocal microscopy and accurate macrophotography
- 3-Total face photography to assess visual surface parameters

In this presentation this new scientific approach in image analysis will be explained by use of concrete study results.
